According to the evidence, a reasonable approach to the treatment in Table 4. is described because there are different points of view on this, we execute a series of pro/editorials with to address this question. The irritation, impact or compression of the lumbar ram often produce more leg pain than back pain. Pain related to sacroil articulation often refers to thigh, but it can also radiate under the knee. Acute low back pain is often nonspecm and, therefore, cannot be attributed to a definitive cause. Most of the reduction of the pain of these medications occurs in the first seven to 14 days, but the benefit can continue for up to four weeks.^{19,20} However, non -benzodiazepine muscle relaxants do not affect the state of disability. A short course (up to five days) of Oral Diazepam (valium) can also be beneficial for pain relief.¹⁹ Because all muscle relaxants have adverse effects, such as drowsiness, dizziness and nysales, they must be used with caution. The examination of lumbosacral regions, LVIC and abdominals can provide clues about underlying abnormalities related to back pain (Table 15.6 and 25,6,8). It is unknown if the NSAIDs are more effective than acetaminophen, but the adding of a aine to acetaminophen therapy is not beneficial that acetaminophen alone. [Carrot], metaxalone [Skelaxin] are beneficial in the treatment of acute low back pain. There is not sufficient evidence to recommend for or against massage therapy for acute low back pain.^{41,26} It is unlikely to be profitable.²⁵ Spinal manipulation and techniques chiropry. A short course of oral corticosteroids has a questionable benefit for With acute root leg pain.³⁴ However, there are no studies to support use use Oral steroids for acute lower back pain. Pain can be moderate to severe and weakening, causing anxiety. Physical therapists often recommend the whole McKenzie or column stabilization exercises for the treatment of low back pain. Non -steroidal anti -inflammatory medications (NSAIDs) are often first -line therapy for low back pain. A reverse leg increase proof (extend the hip and knee flexion while in the PRONA position) is positive for the pain of the nervous rater L3 if it radiates in the previous thigh. Equine cauda syndrome and infections require immediate remission. Often, patients awaken with pain of the maval or develop pain after bending, twisting or lifting. These exits can be sensitive in cases of spinal infection because the lack of fever and a normal blood count are common in patients with spinal infection.¹⁵ Because laboratory tests lack specificity, IRM with and without contrast means and, in many cases, biopsy is essential for a precise diagnosis.¹⁵ Non -specific pain treatment Many treatments are available for acute lower back pain, but strong evidence for your benefit is missing. High quality trials do not show any evidence of benefit with tracción, as an unique treatment or in combination with other treatments, in patients with acute pain or back of back.⁴⁵ There are no studies on acute lower back pain alone.
